Common

- While validating the sample application on Zebu, it is observed that when very short frames is given as input to VIP or very small size sub-frame is configured in VIP or when the display resolution is small, the M4 is not getting time to run the task context. This is because of back-to-back interrupts from the VIP/DSS. Because of this the application task never gets time to execute and hence the application never ends even though the outputs are captured/displayed properly. Hence it is recommnended to use bigger frame size for VIP/DSS. This issue is also due to the fact that the M4 in Zebu is currently configured to run in bypass mode (equivalent to 20 MHz) and also cache is disabled.

VIP Capture Driver

- 24-bit RAW capture - No support in EVM
- RGB888 input to VIP - No support in EVM/Simulator
- Various discrete sync modes except HSYNC/VSYNC mode - No support in EVM
- In case of dual output streams from same capture source, below limitations applies
  - YUV422SP output should always be stream 0 (first stream)
  - For YUV422I scaled and YUV420SP non-scaled outputs, YUV422I scaled output should always be stream 0 (first stream)
  - Scaled outputs on both the streams are not supported

VPE M2M Driver

- YUV444 output is not modeled in Virtio and the test results in hang. This feature is validated/supported only on Zebu/Silicon.

DSS Display Driver

- Blended output (say 1 Video + GRPX) on Virtio is not proper as it is not modeled properly on Virtio

Serial Drivers

- UART Baud rates greater than 115200 are not supported due to high error percentage observed for baud rates greater than 115200.
- UART single byte transfer is supported in Polled Mode and not in DMA Mode.
- A15 needs to be running while loading and running applications on DSP Core

Validation Information

- This release is validated on TDA2xx (Silicon Revisions ES1.0, ES1.1) EVM for the above mentioned components
