Installation and Usage

Installation and Usage of the BSP package could be found at [BSP_UserGuide](#)

Upgrade and Compatibility Information

- **Common**
 - `dcoClk` member is replaced with `pixelClk` in structure `Bsp_PlatformSetPllFreq`, this member should be set to pixel clock frequency in KHz. `dcoClkPostDiv[]` array is removed from the structure `Bsp_PlatformSetPllFreq` in `bsp_platform.h` file.
 - `isCrossBarSettingReq` member is split into two members `isIrqXBarSettingReq` and `isDmaXBarSettingReq` in `Bsp_PlatformInitParams` structure. These variables should be updated accordingly.
 - New `isAllMcSPIInitReq` member added to `Bsp_PlatformInitParams` structure, by default only McSPI1 will be initialized if `isAllMcSPIInitReq` is set to true all four McSPI's will be initialized.
 - `sys_config` library should be added as a dependent library if `bsp_platform` library is used. If this is not taken care linker error is seen for `DMAXBARConnect` function
- **VIP Capture**
 - None
- **VPE M2M**
 - None
- **DSS Display**
 - In Display Controller Driver, `IOCTL_VPS_DCTRL_SET_VENC_OUTPUT` should be called before `IOCTL_VPS_DCTRL_SET_CONFIG`.
- **UART**
 - None
- **McSPI**
 - `configChfmt` structure name changed to `Mcspi_ConfigChfmt` in `bsp_mcspi.h` file
- **I2C**
 - None
- **McASP**
 - None

- **Audio**
 - None

Common

- While validating the sample application on Zebu, it is observed that when very short frames is given as input to VIP or very small size sub-frame is configured in VIP or when the display resolution is small, the M4 is not getting time to run the task context. This is because of back-to-back interrupts from the VIP/DSS. Because of this the application task never gets time to execute and hence the application never ends even though the outputs are captured/displayed properly. Hence it is recommended to use bigger frame size for VIP/DSS. This issue is also due to the fact that the M4 in Zebu is currently configured to run in bypass mode (equivalent to 20 MHz) and also cache is disabled.

VIP Capture Driver

- 24-bit RAW capture - No support in EVM
- RGB888 input to VIP - No support in EVM/Simulator
- Various discrete sync modes except HSYNC/VSYSN mode - No support in EVM

VPE M2M Driver

- YUV444 output is not modeled in Virtio and the test results in hang. This feature is validated/supported only on Zebu/Silicon.

DSS Display Driver

- Blended output (say 1 Video + GRPX) on Virtio is not proper as it is not modeled properly on Virtio

Serial Drivers

- UART Baud rates greater than 115200 are not supported due to high error percentage observed for baud rates greater than 115200.
- UART single byte transfer is supported in Polled Mode and not in DMA Mode.
- A15 needs to be running while loading and running applications on DSP Core

Validation Information

- This release is validated on TDA2xx (Silicon Revisions ES1.0, ES1.1) EVM for the above mentioned components
- In case of serial drivers, this release is validated on TI814x ES2.1 as well
